

Bioregulatory Therapeutic Process

It is recommended to read this thoroughly

Biomedic Bioregulatory therapy is a drug-free **therapeutic process**, where the principle therapist is a Medical Doctor experienced in alternative and complementary medicine. The therapeutic process incorporates a broad range of conventional and non-conventional therapies, **to facilitate self-corrective mechanisms**, also known as homeostasis. Bioregulation is a bio-individualised and multifaceted therapeutic process, which aims to: restore nutritional deficiencies, realign structural resistances, improve cognitive functioning and emotional management, rebalance bioenergetic disturbances and detect, detoxify and protect from environmental health disruptors. Bioregulatory evaluation starts by taking a conventional medical history, assessment, and includes a detailed history of psychological development, emotional issues and stress management. Nutritional and lifestyle analyses follow, as well as an evaluation of auto-regulatory capacities of a patient – often in conjunction with laboratory analysis of nutritional deficiencies and environmental toxicities. A bioregulatory physician then examines the posture and evaluates muscular tension, joint mobility, connective tissue pull, flow of blood, lymphatic and cerebrospinal fluids, and works out the energetic status of a patient. The purpose of initial Biomedic treatment is to establish a personalised status of constitutional and acquired weakness, which defines specificities of each bioregulatory treatment protocol; where follow-up regenerative, preventative or aesthetic treatments aim to bioregulate detected imbalances.
